INF1103 Final Report and Presentation Guidelines

1. Project Report

Your report should be **concise, well-structured,** and **professional**, showing clear understanding of your design, logic, and error handling.

Length: max 6 pages (single column, font size 11 or greater, standard margins).

The page count excludes the title page, table of contents, and appendix.

The report must be **self-contained** - if the examiner needs to investigate the appendix to understand your work, that content will count toward the main page limit.

The structure below is to help you structure your report; it is not an exact template.

Recommended Structure

A. Title Page

Include:

- Project title
- Team ID and team name
- Team members (name, student ID, email)
- Date of submission

B. Introduction (0.5 page)

A short description of the real-world scenario the team has built, this should include any additions since part 1 of your project

C. Diagram (1 to 2 pages)

Any UML and / or other diagrams you have used to help articulate your system design to the examiner and manage your project workflow should be included here. Class diagrams with relationships between classes and a data flow diagram are expected. Note that diagrams and code should be correlated. If a design choice is reflected in the diagram, it should also be reflected in the code, if a design choice is reflected in the code, it should be reflected in the diagram.

D. Data Structure and Storage Design (0.5 pages)

Describe:

- Files / tables used by the application
- Data formats (CSV, JSON, TXT, DB etc.)
- Structure of stored records

E. Exception Handling Matrix (1-2 pages)

Provide a table showing how the application deals with potential errors.

For each scenario, explain:

- What could go wrong.
- How the issue is detected.
- Recovery or mitigation measures.
- Impact on users.

An example scenario:

Exception Scenario	Possible Cause	Detection Method	Handling Strategy	User Outcome
API Connection Failure	Network issue, service unavailable	Request timeout or connection exception	Retry or terminate safely	User notified of service unavailability

F. OOP Concepts, SOLID and new / advanced Features (1 page)

Describe:

- How each mandatory OOP concept is demonstrated in your implementation
- The SOLID principles applied (at least SRP, OCP and LSP), with evidence from your code
- Your new feature and advanced feature: the problem each addresses, how a user accesses it, which classes implement it and how it is tested

2. Presentation and Demonstration Recommended Structure

Your team must give a presentation that includes:

Participation / Presentation

- Every member must speak briefly to practice presentation skills.
- You may divide sections as you prefer (e.g., each person covers what they developed).
- You are expected to be able to answer questions related to your contributions and justify your decisions for your implementation.

Code Structure Overview

Give a clear, high-level walkthrough of your program. Focus on the logic flow — don't explain every line.

System Demonstration

- Show your application, run it from the docker
- Demonstrate all required functions
- Show any enhancement features and unique feature.
- Show your new feature and advanced feature.
- Include a key/crucial test cases to prove correctness.

Time Management

- Keep it concise but informative — Max of 15 minutes total.
- Ensure transitions between presenters are smooth and clear.
